

In order to achieve global carbon neutrality in the middle of the 21st century, efficient utilization of fossil fuels is highly desired in diverse energy utilization sectors such as industry, transportation, building as well as life science. In the energy utilization infrastructure, about 75% of the fossil fuel consumption is used to provide and maintain heat, leading to more ...

The cross-seasonal borehole thermal storage technology is based on the solar heat source exchanging heat with the underground soil through the buried pipe heat exchanger, transporting low-quality heat sources in non-heating season to the underground soil for collection and storage, and extracting and utilizing the stored heat during the heating ...

In the high-cold and high-altitude area in western China, due to the abundant solar energy and hydropower resources, the use of electric auxiliary cross-season solar heat storage heating system ...

storage model and energy system model Source: Abdulrahman Dahash, Fabian Ochs, Michele Bianchi Janetti, Wolfgang Streicher, Advances in seasonal thermal energy storage for solar district heating applications: A critical review on large-scale hot-water tank and pit thermal energy storage systems, Applied Energy, Volume 239, 2019

How to achieve an effective match between the multi-energy complementary heat storage energy supply system and the dynamically fluctuating building heat load demand, is a major challenge facing the heat storage system. ... Zhang Y, Yang HY. Operation strategy of cross-season solar heat storage heating system in an alpine high-altitude area ...

In the high-cold and high-altitude area in western China, due to the abundant solar energy and hydropower resources, the use of electric auxiliary cross-season solar heat storage heating system (CSHSHS) is an effective way to achieve clean heating.

Seasonal thermal energy storage (STES) systems are used to store excess solar energy in summer to supply domestic hot water and space heating in winter, effectively solving the problem of seasonal mismatch between solar energy supply and demand [1], [2], [3]. The advantages of solar STES system mainly including the continuity and economy, in ...

In China, coal is still playing a dominant role in China's energy grid for heating, ventilating, and air conditioning (HVAC), which has a huge impact on the environment [1]. Nowadays, the percentage of respiratory diseases caused by air pollution is more than 30% in China, and the air pollution index is 2-5 times the highest standard recommended by World ...

Fig. 13 (a) shows the development over time of the average stored heat in the seasonal thermal energy storage for different thermal storage capacities. The initial thermal energy storage inventory is 2.5 × 10⁶ kWh. It can be seen that the inventory drops sharply at each transition to the next month due to heat loss.

In order to improve the energy storage and thermal performance of SWHS, a lot of research is focused on the latent heat storage (LHS) of phase change material (PCM), which has high energy storage density and absorbs or releases heat at nearly constant temperature [[10], [11], [12]]. Qi et al. studied the application of LHS in SWHS by using PCM.

The potential of applying STES in combination with renewable energy sources has been investigated for a number of different configurations, including hot-water tanks incorporated in buildings to store solar energy [6, 7], pit storage in district heating (DH) systems combined with waste heat recovery, solar thermal and biomass power plants [8 ...

Thermochemical energy storage, a promising candidate for seasonal solar thermal energy storage, offers an economic solution to mitigate the use of fossil fuels and CO₂ emissions due to its large storage density and almost zero-loss long-term storage. The present article explored the potential of the thermochemical seasonal energy storage system using ...

the performance of solar cross-seasonal energy storage heating systems, particularly in the non-heating season. ?ey built a solar heating system in Hebei, China, combined with 3,000 cubic meters ...

There are three different energy storage mechanisms: sensible heat storage, latent heat storage and chemical reaction/thermos-chemical heat storage [11]. The use of water [12], rock [13] and ground [14] as sensible heat storage media has been studied deeply, while the precise simulation of underground conditions should be further investigated ...

energy during multi-day periods of supply and demand imbalance 6,7. Candidate technologies could include pumped hydro storage (PHS) and compressed air energy storage (CAES). Approaching 100% renewable power systems could require seasonal storage capacities of weeks or months, including hydrogen or other fuels3,4,8. Seasonal storage at the scale ...
