

Phase change energy storage plays an important role in the green, efficient, and sustainable use of energy. Solar energy is stored by phase change materials to realize the time and space ...

LHS, alternatively referred to as phase change energy storage, pertains to the alteration of thermodynamic state (enthalpy) during the phase transition process of PCMs [72] ... However, the inefficiency of 0D materials for PCM encapsulation affects the thermal energy storage efficiency. The reduction in the size of nanoparticles may lead to a ...

Efficient storage of thermal energy can be greatly enhanced by the use of phase change materials (PCMs). The selection or development of a useful PCM requires careful consideration of many physical and chemical ...

Solar energy is a high-priority clean energy alternative to fossil fuels in the current energy landscape, and the acquisition, storage, and utilization of solar energy have long been the subject of research [[1], [2], [3], [4]]. The development of new materials has facilitated the technique for utilizing solar energy [5], such as phase change materials (PCMs), which have ...

Phase change materials show promise to address challenges in thermal energy storage and thermal management. Yet, their energy density and power density decrease as the transient melt front moves ...

Thermal energy storage (TES) using phase change materials (PCM) have become promising solutions in addressing the energy fluctuation problem specifically in solar energy. However, the thermal conductivity of PCM is too low, which hinders TES and heat transfer rate. ... solar energy is the most efficient energy source, as it is environmentally ...

The light-to-thermal energy storage efficiency (α) was calculated according to the following equation [61], and recorded as mean values \pm S.D. (1) $\alpha = \frac{m \cdot D H}{r \cdot S \cdot (t - t_f)}$ where α is light to heat and energy storage efficiency, m is sample weight, DH is melting transition enthalpy obtained by DSC, r is the light irradiation intensity, S ...

Utilizing phase change materials with high energy density and stable heat output effectively improves energy storage efficiency. This study integrates cascaded phase change with a cross-seasonal ...

Our results showed that the phase change efficiency of magnetic phase change material can be improved by magnetic field application. With the increasing magnetic strength, the photo-thermal storage efficiency ...

As evident from the literature, development of phase change materials is one of the most active research fields

for thermal energy storage with higher efficiency. This review focuses on the application of various phase change materials based on ...

Therefore, the conversion and storage of solar energy is the key to realize the sustainable and efficient utilization of energy. Phase change materials (PCMs) are significant and attractive materials for solar energy storage with high energy storage density, quite small temperature variation and considerable applicability. ... HDA was used as ...

Using the computer-aided molecular design (CAMD) method, the best phase-change ionic liquid [MPyEtOH][TfO] is identified for efficient thermal energy storage. This material shows a higher heat storage performance than the traditional phase-change material paraffin wax. Download: Download high-res image (282KB) Download: Download full-size image

Traditionally, water-ice phase change is commonly used for cold energy storage, which has the advantage of high energy storage density and low price [10]. However, owing to the low freezing point of water, the efficiency of the refrigeration cycle decreases significantly [11].

Among the many energy storage technology options, thermal energy storage (TES) is very promising as more than 90% of the world's primary energy generation is consumed or wasted as heat. 2 TES entails storing energy as either sensible heat through heating of a suitable material, as latent heat in a phase change material (PCM), or the heat of a reversible ...

The metal foam/phase change material (PCM) composite is a promising material in the thermal energy storage system. In the present study, a modified structure of metal foam, finned metal foam with graded porosity (FFGP), is proposed to further accelerate the melting process of the composite. The finite volume method and two equations model are applied in ...

Meanwhile, some studies based on the phase-change CO₂ energy storage system also have had the disadvantages of low efficiency and the extra necessity of heat or cooling sources. To overcome the above problems, this paper proposes an innovative compressed CO₂ phase-change energy storage system.
