

Furthermore, at 200 MV/m, which is the working condition of BOPP film capacitors in common power systems such as electric vehicles [55], the sandwich-structured PPS films with 200 nm  $\text{Al}_2\text{O}_3$  coating shows almost negligible energy loss (i.e.,  $<1\%$  and  $<2\%$  at 150 ° and 200 °, respectively) and considerably higher  $U_d$  (i.e., 0.75 J/cm<sup>3</sup> at ...

the spin-coating method, the dielectric and energy storage properties of composite films can be better studied. The experimental results confirmed that the spin-coating process is the simplest and most direct preparation method to obtain ceramic/polymer composites with excellent dielectric and energy storage properties.

Figure 4b compares the energy storage performance of our films with those of state-of-the-art dielectrics, for example, the lead-based  $\text{Pb}(\text{Mg}_{1/3}\text{Nb}_{2/3})\text{O}_3$ - $\text{PbTiO}_3$  film with  $U_e$  of 133 J cm<sup>-3</sup> ...

**Keywords:** Film capacitor, Dielectric property, Boron nitride nanosheets, Surface coating, Energy storage characteristics  
**Abstract** The further electrification of various fields in production and daily life makes it a topic worthy of exploration to improve the performance of capacitors for a long time, including thin-film capacitors.

Assembling individual MXene nanosheets into macrostructures is an essential process in its practical application. Typically, such macrostructures mainly include MXene films, foams/aerogels, and fibers [18], [19]. With the progress of society and the rapid development of science and technology, there is now increasing demand for portable and compact energy ...

films, respectively. The effect of inorganic coating layer on the high-temperature energy storage performance has been systematically investigated. The favorable coating layer materials and appropriate thickness enable the BOPP films to have a significant improvement in high-temperature energy storage performance. Specifically, when the aluminum

Electrostatic capacitors are among the most important components in electrical equipment and electronic devices, and they have received increasing attention over the last two decades, especially in the fields of new energy vehicles (NEVs), advanced propulsion weapons, renewable energy storage, high-voltage transmission, and medical defibrillators, as shown in ...

To further verify the effect of adding these two types of core-shell particles on the energy storage density of PVDF composite films, finite element simulations were conducted to analyze the energy storage density of composite films under electrostatic field, and the results are shown in Fig. 9 (e, f, g). The composite film is affected by both ...

For the fabrication of thin films, Physical Vapor Deposition (PVD) techniques specified greater contribution

than all other deposition techniques. Laser Ablation or Pulsed Laser deposition (PLD) technique is the one of most ...

A key factor affecting the energy storage performance of antiferroelectric materials is their electrical breakdown strength. Nanocomposition is one of the effective methods to improve the electrical breakdown strength of dielectric thin films. In this study,  $\text{PbZrO}_3\text{-Al}_2\text{O}_3$  nanoparticle composite films were prepared by combining chemical solution deposition of ...

Achieving a consistent film coating of EC active materials is crucial for its optimal electrochemical performance in ECB. Additionally, the coating method should be simple, affordable, and adaptable for large-scale production. ... Furthermore, the energy storage performance of the film was assessed in different hybrid electrolytes through ...

For the fabrication of thin films, Physical Vapor Deposition (PVD) techniques specified greater contribution than all other deposition techniques. Laser Ablation or Pulsed Laser deposition (PLD) technique is the one of most promising techniques for the fabrication of thin films among all other physical vapor deposition. In particular, flexible thin-film energy storage ...

Compared with batteries and supercapacitors, dielectric capacitors have the advantages of fast charging/discharging, high power density, and long lifetime, which makes them widely used in the pulse power fields [1, 2]. Polymer films are more favourable for capacitors because of the high insulation property, good flexibility, low cost and ease of preparation on a ...

Electrochemical energy storage and conversion are represented as the most effective technologies for the utilization of energy. To obtain higher energy densities and energy conversion efficiency, developing advanced high-performance materials and thin films for electrochemical energy storage and conversion is of vital importance. This Special ...

In the realm of energy storage, the application of thin film coating at the interface of the electrolyte/electrode for all-solid-state LIBs significantly enhance the energy density and safety. In general, the remarkable versatility of thin film materials enables the integration of complex functionalities in a compact form while offering avenues ...

The effect of inorganic coating layer on the high-temperature energy storage performance has been systematically investigated. The favorable coating layer materials and appropriate thickness enable the BOPP films to ...
