Energy storage makes a critical contribution to the energy security of current energy networks. Today, much energy is stored in the form of raw or refined hydrocarbons, whether as coal heaps or oil and gas reserves. Since energy storage is far more efficient, power precursors are stored instead of electricity, and demand for generation varies.

Although using energy storage is never 100% efficient--some energy is always lost in converting energy and retrieving it--storage allows the flexible use of energy at different times from when it was generated. So, storage can increase system efficiency and resilience, and it can improve power quality by matching supply and demand.
