Calise et al. focus on a sustainable mobility model that includes solar energy and storage. They find that storage results in grid savings between 12% and 19%, emission savings of about 67-72% ...

TES systems are divided into two categories: low temperature energy storage (LTES) system and high temperature energy storage (HTES) system, based on the operating temperature of the energy storage material in relation to the ambient temperature [17, 23]. LTES is made up of two components: aquiferous low-temperature TES (ALTES) and cryogenic ...

PV systems with LIBs as storage have lower environmental impacts on the whole life cycle than the traditional storage system, LABs. This is mainly due to the short lifespan of the latter and the toxicity of the lead used as electrodes. It also appears that the end-of-life management of the PV system influences the overall impact.
