As a result, solar energy applications need active thermal energy storage so that the amount of thermal energy collected during the day can be stored and reused during the night. Hence, a heat storage system is required [2]. Thermal energy storage (TES) methods used in a thermal solar system can be divided into two categories:  
o Sensible heat ...

The collectors transform but not store the solar energy. The storage is accomplished in a storage tank. The heat storage system can be used as a buffer to mitigate the fluctuation of solar incidence. The present study summarizes the investigation of improving thermal energy storage extracted from solar heater and use for domestic purpose.
