developing areas. Energy self-sufficiency has been defined as total primary energy production divided by total primary energy supply. Energy trade includes all commodities in Chapter 27 of the Harmonised System (HS). Capacity utilisation is calculated as annual generation divided by year-end capacity x 8,760h/year. Avoided

These sectors have a cumulative emissions budget of 830 megatonnes for the period 2021-2030. In the projection, the Netherlands stays well below this figure with 781-819 megatonnes, which is partly due to the sharp decrease in emissions over the past two years because of COVID-19, higher energy prices, and the rapid growth in wind- and solar ...

and energy poverty) o 1 bcm reduction in agriculture o 1 bcm other the demand of natural gas the growth of renewable energy conversion of energy units 1 petajoule (pj) can provide a city like tilburg with electricity for a year the import gap of the netherlands climate pricing deficit options to close the gap 1 reduce energy demand
