In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6]. Fig. 1 shows the current global ...

It all has to do with the equation for the capacitive energy storage, namely the energy stored in a capacitor with capacitance  $C$  charged from a power supply at some constant potential  $V$  is given by:  $E = 0.5 \cdot C V^2$ . This represents half of the energy drawn from the power supply during charging, with the other half being "used up" as the charging
