Aluminum is a critical material for the energy transition. It is the second most-produced metal by mass after iron and demand for it has been growing globally at an average rate of 5.3% over the past decade [1]. Aluminum's abundance makes it available with a benignly rising cost to output cumulative supply curve which can accommodate continuing rise in demand [2].

Aluminum batteries employing organic electrode materials present an appealing avenue for sustainable and large-scale energy storage. Nevertheless, conventional organic materials encounter limitations due to their restricted active sites, known instability, and ...
