A novel heat exchanger (HEX) with phase change material (PCM) is proposed to recover the waste heat from the flue gas of a combi-boiler. The thermal energy that is recovered from the flue gas is stored within the PCM-HEX when the combi-boiler works in the central heating mode.

Thermal energy storage (TES) using phase change materials (PCM) has been widely investigated for various applications from very low to very high temperatures due to its flexible operating temperature range, high energy storage density, and long-life cycle at a reasonable cost. ... the thermal energy in this loop is acquired from a boiler, heat ...

In the scale-up from 3 kW to 30 kW, the project used a liquid metal pool boiler to transfer heat from the TES to the engine heater head. This is the primary innovation, resulting in much more dramatic heat transfer rates (10%+ increase) between the TES and the power block. ... and Maurice White. Phase change materials (PCMs) are also well-known as phase change energy storage materials. Through phase change, it may release and absorb considerable latent heat without changing the temperature. PCMs have the advantages of small size, a wide range of phase change temperatures, high thermal storage density, and energy stability, and it is ...

The temperature that the heat is stored at can be varied by the use of different PCMs (phase change material) and for space heating would typically be between 21 °C- 28 °C. Thermal Batteries. Whilst there is a huge marketing push on electrical domestic storage batteries, heat batteries are still relatively uncommon.
