Intermittency is growing on the Swedish grid as more renewable energy sources come online, and the capacity of the country's existing large pumped hydro energy storage (PHES) portfolio to balance this is being exhausted. Battery storage projects are being launched to make up the shortfall as the country seeks net zero by 2045.

However, as the grid becomes increasingly dominated by renewables, more and more flow batteries will be needed to provide long-duration storage. Demand for vanadium will grow, and that will be a problem. "Vanadium is found around the world but in dilute amounts, and extracting it is difficult," says Rodby.

The low energy density of vanadium batteries is a major disadvantage. Comparison vanadium battery vs lithium, due to the relatively large molecular mass of vanadium, the energy density of vanadium battery is only 12-40Wh/kg, which is only one tenth of that of lithium battery. However, the volume is 3-5 times that of lithium batteries,
