A 33 tantalum capacitor (AVX brand) is selected as the energy storage device. The tantalum capacitor has a remarkable smaller leakage loss than the electrolytic capacitor, which is suitable for the harvested energy conservation. The stored energy inside the capacitor is calculated according to Equation (4):

capacitors have 2.5 times less inductance compared to the same nominal tantalum capacitors, which had $L = 12.5 \text{ nH}$. This value is consistent with 10.9 nH for 5.6 OF low ESR tantalum capacitors reported in [11]. Similar results were obtained in [18], where ceramic capacitors had lower ESL compared to tantalum parts of similar size.

Tantalum Capacitors: Characteristics and Component Selection introduction Tantalum capacitors are capacitors constructed with tantalum material used to form the anode of the capacitor. Tantalum capacitors are

electrolytic capacitors, which means the capacitor is formed by an oxide layer formed on the anode and is thus polarized.

To create energy storage capacitors, certain fundamental steps and materials are essential. 1. Selection of Materials, 2. ... Selection of Materials, 2. Layering Process, 3. Encapsulation, 4. ...
