

Does Togo have a potential for wind energy?

Togo's potential for wind energy is not high. Our study also identified a number of challenges with renewable energy, however. For example, the Togolese government needs to determine the generation potential from various renewable energy sources. The head of a renewable energy research centre said:

Can solar PV and hydropower improve the energy situation in Togo?

With a three rounds Delphi method, the study captured the view of key stakeholders on the subject matter. It has been concluded that increasing the share of RE, namely solar PV and hydropower, could significantly improve the energy situation in Togo. This could be through the installation and development of small-scale solar plants and hydropower.

What are energy systems in Togo?

Energy systems in many countries, including Togo, are a balance between energy that's generated centrally at a large scale and energy that's generated at a smaller scale closer to where it's used. Balancing the two sources makes energy supply more reliable and stable.

Why does Togo rely on wind and photovoltaics?

Additionally, wind and photovoltaics (PV) contributed significantly to the security of supply, as demand could not have been met by domestic conventional and nuclear generation capacities of up to 424 h in 2018. Togo, like many sub-Saharan African countries that do not produce oil, depends mostly on imports for its electricity supply.

Where does Togo get its energy from?

To meet demand, Togo has to import most of its energy from Ghana, Cote D'Ivoire and Nigeria. The country's main source of energy is biomass. About 76% comes from firewood, charcoal and vegetable waste. Petroleum products account for just over a quarter of energy needs, while electricity derived from thermal, hydropower and solar accounts for 4%.

Can Togo achieve universal access to electricity by 2030?

The small West African country plans to achieve universal access to electricity by 2030. Its main challenges are capacity, technology and expertise for generation. To meet demand, Togo has to import most of its energy from Ghana, Cote D'Ivoire and Nigeria. The country's main source of energy is biomass.

In comparison to solar energy, wind energy has only been used to pump groundwater; however, an initial exploration has shown that Togolese wind resource is not competitive compared to other...

The study stems from the fact that Togo like most African countries has a lot of natural resources such as solar, wind and hydro-electric power required to implement a nationwide sustainable energy system.

Most of them indicated there was significant potential in renewable energy, primarily solar (70% of respondents) and hydropower (80%). Togo's potential for wind energy is not high.

Introduction: Togo, situated in West Africa, is embracing renewable energy solutions to address its energy challenges and foster sustainable development. In recent years, residential renewables have gained momentum as households seek clean, reliable, and affordable alternatives to traditional energy sources. This article examines the evolving trends ...

Discover the potential of green hydrogen production in Togo using biomass, solar, and wind resources. Detailed maps and datasets reveal the availability in each canton. Biomass emerges as the leading resource, with significant impact in ...

This study presented the view of key stakeholders in relation to renewable energy development (mainly solar and hydropower) in the energy mix of Togo, highlighting the current energy situation and actions planned for the ...

Onshore wind: Potential wind power density (W/m^2) is shown in the seven classes used by NREL, measured at a height of 100m. The bar chart shows the distribution of the country's land area in each of these classes compared to the global distribution of wind resources. Areas in the third class or above are considered to be a good wind resource.

This study presented the view of key stakeholders in relation to renewable energy development (mainly solar and hydropower) in the energy mix of Togo, highlighting the current energy situation and actions planned for the development to increase energy access in Togo.

It was concluded that increasing the share of renewable energy, namely solar PV and hydropower, could significantly improve the energy balance in Togo. This could be done through the construction and development of small-scale solar and hydro power plants.
