In 2022, Switzerland derived 6% of its electricity from solar power. Studies show that installing solar panels on mountaintops in the Swiss Alps could produce at least 16 terawatt-hours (TWh) a year, approaching half of the nation's 2050 solar energy target. Typically, solar panels in Switzerland are mounted on existing infrastructure like mountain huts, ski lifts, and dams, with larger-scale installations in the Alps remaining rare.

The types of energy most used are petroleum products, electricity from hydroelectric and nuclear power plants, and natural gas. Renewable energies have been steadily gaining ground in recent years, especially solar power.

On behalf of the Swiss Federal Office of Energy, Swissolar is mandated to survey the Swiss solar market and publish the annual installed capacity in the Report: "Le recensement du marché de l'énergie solaire en 2019". The data therein is based on a survey amongst 628 companies active in the PV and solar thermal market.

The overview shows that the PV potential is spread over a variety of types of systems, each with different advantages and disadvantages. PV systems on roofs in the Swiss lowlands are cheapest, but produce the least winter electricity.

The significance of photovoltaics is increasing greatly both nationally and internationally in the context of sustainably organised energy supplies. In Switzerland's Energy Strategy 2050, the plan is to supply almost half of the electricity required from ...

Solar energy, which reaches the earth's surface in the form of light and heat and can be actively utilised in a variety of ways: with the aid of photovoltaic systems for electricity production, through the use of solar

collectors for heat production (hot water and auxiliary heating) or through the use of concentrating systems for activating ...

Applications of PV in Switzerland are primarily roof-top grid-connected PV systems. Off-grid, ground-mounted, VIPV applications are still very scarce while an increasing number of building
