At this time the amount of removable energy is determined by each responsive demand. Therefore, the amount of energy carrier generation in each auxiliary EH is determined in the grid. Then decisions are made on the main EH generations to minimize grid losses. Thereafter, a functional status for energy storage is achieved.

The calculation of SC auxiliary energy storage for BHEV applications whereby the DBD gives the lower capacitance compared to the ABD; thus, it is lower in weight, volume, and cost. A novel and less complex SC current control strategy for BHEV, relative to the previously reported work as in [1], have been presented in the literature.
