The fluctuation and intermittency of wind power generation seriously affect the stability and security of power grids. Aiming at smoothing wind power fluctuations, this paper proposes a flywheel-battery hybrid energy storage system (HESS) based on optimal variational mode decomposition (VMD). Firstly, the grid-connected power and charging-discharging ...

In this paper, a flywheel energy storage that is an integral part of a wind turbine rotor is proposed. The rotor blades of a wind turbine are equipped with internal weights, which increase the inertia of the rotor.

Following that, the idea of the flywheel energy storage in a wind turbine rotor is introduced in detail. Subsequently, simulations demonstrate the behavior and the capabilities of the system. 2 Wind Turbine Simulation Model. The wind turbine type considered here is a variable speed, pitch to feather wind turbine. It has a conventional drive ...

Optimal sizing of wind power plants with flywheel energy storage systems is crucial for maximizing their efficiency and economic viability. The sizing of the wind turbine and the energy storage system should be optimized to balance the power output of the wind turbine with the energy demand of the grid. To determine the optimal sizing, number ...

We know that the wind generators deliver a variable electrical power due to the nature of the wind speed, to overcome this problem, a flywheel energy storage system ensure the balance between the production (wind generator) and consumption (the demand) [] by the following conditions: If the reference power of Flywheel ( $\{P\}_{w-ref}$ ) positive, then the ...

The paper presents the issues of a wind turbine-flywheel energy storage system (WT-FESS) operation under real conditions. Stochastic changes of wind energy in time cause significant fluctuations of the system output power and as a result have a negative impact on the quality of the generated electrical energy. In the author's opinion it is ...

The main problem of the wind power is its stochastic availability. The pulsation of the wind speed causes

power pulsation, resulting in deterioration of the power quality. To compensate it, energy storage is necessary. Considering the wind spectrum, different storage systems can be used for the different frequencies of the wind speed variation. The short time turbulent power pulsation ...

Many have focused on its application in renewable energies [5], especially in power smoothing for wind turbines [7]. There is also one investigation into the automotive area [8]. ... Energy storage technology is becoming indispensable in the energy and power sector. The flywheel energy storage system (FESS) offers a fast dynamic response, high ...

Wind energy integration into power systems presents inherent unpredictability because of the intermittent nature of wind energy. The penetration rate determines how wind energy integration affects system reliability and stability [4]. According to a reliability aspect, at a fairly low penetration rate, net-load variations are equivalent to current load variations [5], and ...

Flywheel energy storage system (FESS) will be needed at different locations in the wind farm, which can suppress the wind power fluctuation and add value to wind energy. A FESS that can store up to 3.6 kWh of usable energy in 12 minutes at a maximum 24,000 r/m was designed. Multiple flywheels can be interconnected in an array, or matrix, to provide various ...
