

Working principle of energy storage motor

The energy stored to these flywheel are proportional to their square of rotating speed. A torque is applied to the flywheel to store rotational energy and when needed; energy is released from flywheel in the form of torque applied on the mechanical load. Thus it increase its rotational speed while storing energy and loose while releasing it.

Potential Energy Storage Energy can be stored as potential energy Consider a mass, m , elevated to a height, h Its potential energy increase is $EE = mgh$, where $g = 9.81 \text{ m/s}^2$ is gravitational acceleration Lifting the mass requires an input of work equal to (at least) the energy increase of the mass

Functions of Flywheel.
